ABOUT

Engineer passionate about robotics, electronics and software. I stepped away from employment to build something with my own hands, and I aim for it to become something useful that can create jobs and opportunities. I believe now is the right time for robotics and physical AI, and that there is real room to build here, not by competing with the big players, but by filling gaps in sectors they haven't reached yet.

EXPERIENCE

Robotics & Physical AI · Independent — Aug 2026 – Present
Left a senior architect role to go all-in on robotics and physical AI. Building robot prototypes hands-on and studying imitation learning for robotic manipulation.

IoT & AWS Solutions Architect · Sense Reply — Jul 2023 – Jul 2026
Designed cloud-native IoT platforms on AWS for enterprise clients in energy and e-mobility, from requirements to production. Enabled near real-time telemetry and remote monitoring of distributed device fleets, and contributed to migrating legacy and SaaS solutions to proprietary cloud-native platforms.

Smart IoT Product Solutions Designer · Olivetti — Jan 2021 – Jul 2023
Designed and prototyped IoT solutions for smart city, smart warehouse, e-health and energy, turning customer needs into requirements and following them through to go-live. Started as a backend developer on remote patient monitoring and smart energy platforms.

WHAT I BRING TO A FOUNDING TEAM

I can build the product end-to-end.
Hardware, electronics, firmware, software and cloud: from robot prototypes designed from scratch to IoT platforms running in production.

I know how to make it work at scale.
Architected IoT platforms for enterprise clients managing fleets of 10,000+ connected devices, including a major European utility.

I turn customer needs into product.
Technical point of reference for clients across enterprise accounts, following solutions from requirements to release.

I lead and coordinate.
Mentored junior engineers in a 7-person team and coordinated with other teams on product development.

THINGS I HAVE BUILT

Robot arm for physical AI in progress
Arm to be trained from human demonstrations using imitation learning.

Mobile robot prototypes
Designed from scratch: parametric CAD, 3D-printed chassis, motor control electronics, radio control.

Wi-Fi controlled robot with camera
Driven remotely from a web interface with live video streaming.

Air quality monitor
ESP32 node with a laser-scattering particulate sensor (PM2.5), streaming telemetry to a time-series database with a live dashboard.

Personal finance automation
Reads bank emails, classifies expenses with AI and loads them into a self-hosted tracking system with recurring spending reports.

Self-hosted home server
Raspberry Pi running Nextcloud, with automated backups and secure remote access.

EDUCATION

Postgraduate Master in Smart Product Design 4.0 · Politecnico di Torino — 2021 – 2023
Industry master run with Olivetti, completed while working full-time. Product and design thinking applied to smart connected products, from user needs to working prototypes.

MSc in Mechatronic Engineering · Politecnico di Torino — 2017 – 2020
Thesis: Modeling and identification of wheel-soil interaction for precision agriculture robotics.

BSc in Aerospace Engineering · Politecnico di Torino — 2012 – 2017
Thesis: Numerical model of dry friction applied to an electro-hydraulic servomechanism.

SKILLS & MORE

Robotics & hardware	CAD, 3D printing, electronics, ESP32, ROS 2, imitation learning
Software & cloud	Python, C, AWS, IoT platforms, Docker, Kubernetes
Certifications	AWS Certified Solutions Architect – Professional (2025), Associate (2024)
Languages	Italian (native), English (B2, IELTS 6.5)
Interests	Chess, photography, finance, cinema
